Specialist Laparoscopic Surgeons for all General and Bariatric Surgery

Mr. Richard Gilhome, Mr. Chris Hensman, Mr. Ray McHenry,

Diagnosis and Treatment of Oesophageal conditions and Reflux Disease

ManoScan 360™
High-Resolution Manometry

Mr. Chris Hensman

At LAP Surgery Australia we have the state-of-the art ManoScan 360 high resolution impedance manometry system, one of the only units in Australia. This modern machine allows us to obtain highly detailed pressure charts of oesophageal function. It also allows us to assess food bolus transport, the most important factor in assessment of Dysphagia, and parameter not assessed by other modalities.

Mr. Chris Hensman along with Cheryl our Clinical Nurse Specialist run this Diagnostic Clinic at our Head office in Boronia.

We offer a full range of diagnostic procedures, as well as medical, surgical and minimally invasive treatment options to meet the individual needs of patients with oesophageal conditions. In cases of diagnostic uncertainty, a single referral to our clinic will cover all diagnostic and therapeutic requirements.

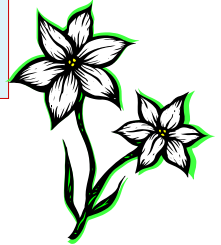

Our Centre provides diagnosis and treatment for common and rare conditions of the oesophagus, including:

- Gastro-oesophageal reflux disease (GORD) and heartburn
- Dysphagia
- Barrett's oesophagus
- Oesophageal achalasia
- Hiatal hernia
- Oesophageal diverticula (including Zenker's diverticulum)
- Cancers of the oesophagus (squamous cell carcinoma and adenocarcinoma)
- Submucosal tumors of the oesophagus

For the patient who is also not responding to medications or for those that may have atypical symptoms such as chest pain, coughing, wheezing, hoarseness, sore throat & volume reflux a referral to us for assessment means simply a phone call.

Phone 9760 2777 for all appointments (referral pads are available)

Bariatric Surgery

Intra-Gastric Balloon

This procedure is a day case in hospital and is targeted to the patient with a BMI of 27 to 35. The balloon is inserted into the stomach via a gastroscope and is removed six months later. We offer a twelve month program to help the patient achieve long term weight loss.

Adjustable Gastric Band

For patients with a BMI of over 35. This is a very safe and effective treatment for Obesity. Long term follow up after surgery is essential to ensure successful outcomes.

Sleeve Gastrectomy and Gastric Bypass

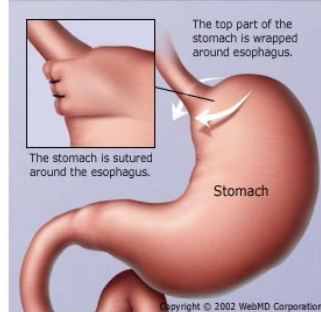

These are advanced bariatric procedures for patients who are not suitable for the gastric band or have not succeeded with the band. These procedures may also be offered as salvage surgery for previous gastric stapling.

LAPsurgery Australia has treated over 4,000 patients for obesity.

All post op care for bariatric patients is charged at Medicare Rebate only

Laparoscopic Nissen Fundoplication

Antireflux Surgery

All three of our surgeons perform

Laparoscopic Nissen Fundoplication at Knox Private in Wantirna, The Valley Private in Mulgrave, Mitcham Private in Mitcham, St John of God in Berwick and The Bays in Mornington.

Patient selection is a key factor in the success of this surgery. Oesophageal Manometry & PH monitoring is performed prior to surgery to assess for Gastro-oesophageal reflux disease (GORD). The surgery is performed laparoscopically and the patient is hospitalized for approx. 2 - 3 nights.

Our success rate with patients having Laparoscopic Nissen Fundoplication is 90-95% with patients advising us that they have had an excellent result from surgery and that they are thrilled not to have to take medication anymore.

DVA patients are treated with no out of pocket costs

This service includes:

- All Bariatric procedures
- All General Procedures
- All Dietitian care
